

16.216: ECE Application Programming

Fall 2011

Programming Assignment #4: A Simple Calculator

Due **Friday, 10/7/11**, 11:59:59 PM

1. Introduction

In this assignment, you will work with C conditional statements to implement a simple calculator program. You will also work with basic output formatting when printing your results.

2. Deliverables

Submit your source file using our course site in Blackboard; you should be able to access the site through <https://continuinged.uml.edu/login/login.cfm>.

Ensure your source file name is ***prog4_calc.c***. You should submit only the .c file. Failure to meet this specification will reduce your grade, as described in the program grading guidelines.

3. Specifications

Input: Your program should prompt the user to enter the following:

- The desired precision for the result and operands
- A simple arithmetic expression of the form $a \text{ op } b$, where a and b are operands and op is one of the following operators: $+$, $-$, $*$, $/$.
Examples include:

- $5 + 3$
- $-0.777 * 17.175$
- $22 / 11$
- $-1.2 - -3.4$

Output: Given a valid expression, your program should calculate the result and reprint the entire expression as well as its result, using the desired precision. If the precision is 2, the expressions listed above will produce the following output:

- $5.00 + 3.00 = 8.00$
- $-0.78 * 17.18 = -13.34$
- $22.00 / 11.00 = 2.00$
- $-1.20 - -3.40 = 2.20$

See Section 4: Test Cases for more sample program runs.

Error checking: Your program should print an error and immediately exit under any of the following conditions:

- Any of the inputs are incorrectly formatted and therefore cannot be read correctly using `scanf()`.
- The precision is not a valid value (must be ≥ 0).
- The user tries to divide by 0.
- The operator entered is not a valid operator.

4. Test Cases

Your output should match these test cases exactly for the given input values. I will use these test cases in grading of your lab, but will also generate additional cases that will not be publicly available. Note that these test cases may not cover all possible program outcomes. You should create your own tests to help debug your code and ensure proper operation for all possible inputs.

```
C:\windows\system32\cmd.exe
Enter precision: 3
Enter expression: 7.1759 + 1.23456
7.176 + 1.235 = 8.410
Press any key to continue . . .
```

```
C:\windows\system32\cmd.exe
Enter precision: 1
Enter expression: 3 / 2
3.0 / 2.0 = 1.5
Press any key to continue . . .
```

```
C:\windows\system32\cmd.exe
Enter precision: 0
Enter expression: 1.975 - 0.995
2 - 1 = 1
Press any key to continue . . .
```

Remember, if you are using Visual Studio, to get your program to terminate with a message saying, "Press any key to continue ...", use the **Start Without Debugging** command (press Ctrl + F5) to run your code.
