

16.216: ECE Application Programming

Spring 2014

Lecture 8: Key Questions

February 10, 2014

1. **Example:** Write a short code sequence that does each of the following:
 - a. Given `int x`, check its value. If `x` is more than 5 and less than or equal to 10, print `x`
 - b. Prompt for and read temperature as input (type `double`). If `temp` is 90 or higher, print “It’s too hot!” If `temp` is 32 or lower, print “It’s freezing!” In all other cases, print “It’s okay”
 - c. Read 3 `int` values and print error if input problem
 - If fewer than 3 values read, print error message with number of values
 - Example: `Error: only 2 inputs read correctly`

2. Describe the basic format of a `switch` statement, including its general usage, the use of `case` and `default`, and the use of the `break` statement.

3. Describe a situation in which you might not want to use a `break` statement at the end of a given case.

4. **Example:** Given the code below:

```
int main() {
    char grd;

    printf("Enter Letter Grade: ");
    scanf("%c",&grd);
    printf("You are ");

    switch (grd) {
    case 'A' :
        printf("excellent\n");
        break;
    case 'B' :
        printf("good\n");
        break;
    case 'C' :
        printf("average\n");
        break;
    case 'D' :
        printf("poor\n");
        break;
    case 'F' :
        printf("failing\n");
        break;
    default :
        printf("incapable of reading directions\n");
        break;
    }
    return 0;
}
```

What does the program print if the user inputs:

- a. A
- b. B+
- c. c
- d. X

5. How could we easily change each case to recognize both upper and lowercase inputs?
